

Disassembling a Stock (Tungsten) Triad Drive

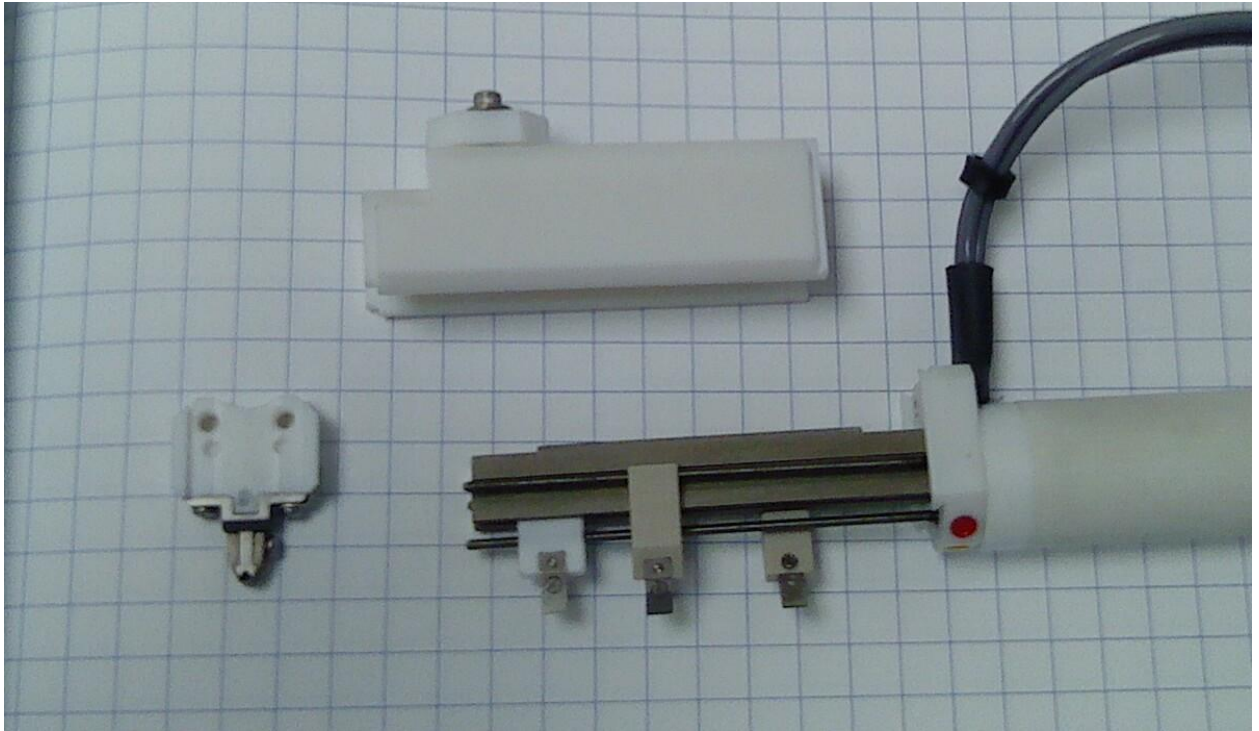

- 1) Undo the screws at the top (holding the cable bracket and body together) and bottom (holding the foot on to the body).

- 2) Use gentle pressure on both ends to push the body off of the motor and foot dovetails.

- 3) Remove the foot, keeping the girder in place.

- 4) Reinstall the body without the foot present (this helps keep the arms on the girder).
- 5) Advance the arms off the ends of their threaded rods.

For reassembly:

- Check the threaded rod threads for fouling before reassembly.
- Apply a small amount of silicone oil to the threaded holes in the arms and to the threaded rods as-needed.
- When reinstalling the body, make sure the body is snug against the girder (i.e. that the girder is all the way back against the body). Otherwise the arms can jam.
